

# Problem Set 1

Sebastian Urbina

25 September, 2023

From the files section on CourseWorks, download the file fec22.txt, which contains data for candidate political action committees for the 2022 elections in the U.S. Use the file fec.codebook.txt to see the values for the fields. Write R code to do the following.

```
#Loading packages  
library(tidyverse)
```

```
## -- Attaching core tidyverse packages ----- tidyverse 2.0.0 --  
## v dplyr      1.1.3      v readr      2.1.4  
## v forcats    1.0.0      v stringr   1.5.0  
## v ggplot2    3.4.3      v tibble    3.2.1  
## v lubridate  1.9.2      v tidyr     1.3.0  
## v purrr      1.0.2  
## -- Conflicts ----- tidyverse_conflicts() --  
## x dplyr::filter() masks stats::filter()  
## x dplyr::lag()     masks stats::lag()  
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

```
library(haven)  
library(psych)
```

```
##  
## Attaching package: 'psych'  
##  
## The following objects are masked from 'package:ggplot2':  
##  
##    %+%, alpha
```

1. Read the data into a data object called fec22.df using the appropriate command. Report the number of records/observations in the data.

```
#Importing data fec22.txt local disc  
setwd("/Volumes/TOSHIBA EXT/1.1_Columbia University/Fall 2023/POLSGU4716_001_2023_3 - Data Science for I  
getwd()
```

```
## [1] "/Volumes/TOSHIBA EXT/1.1_Columbia University/Fall 2023/POLSGU4716_001_2023_3 - Data Science for
```

```
fec22.df <- read.delim("fec22.txt", header=FALSE, , sep = "|")
```

```
# Number of records/observations in the data
print(dim(fec22.df))
```

```

```

3. Subset the data to produce two different data objects—one for Senate candidates and one for House candidates (the variable *CAND OFFICE DISTRICT* equals 0 for Senate candidates, is greater than 0 for House candidates). Do a check that will give you a sense that the subsetting worked correctly.

```
sen_df <- fec22.df %>%
  filter(V20 == 0)

describe(sen_df$V20)
```

```
##      vars   n mean sd median trimmed mad min max range skew kurtosis se

```

4. Calculate and report the mean, median, and standard deviation for total receipts (variable name TTL RECEIPTS) for races for each chamber. Do this for the subsets produced in the previous step without using dplyr. Also do this on the original data that you read in (i.e., fec22.df) using dplyr and compare the results from the two approaches.

```

results <- matrix(NA, nrow = 2, ncol = 3 )
results[1,1] <- round(mean(sen_df$V6),0)
results[1,2] <- round(median(sen_df$V6),0)
results[1,3] <- round(sd(sen_df$V6),0)
results[2,1] <- round(mean(hou_df$V6),0)
results[2,2] <- round(median(hou_df$V6),0)
results[2,3] <- round(sd(hou_df$V6),0)

colnames(results) <- c("Mean","Median","SD")
rownames(results) <- c("Senate candidates"," House candidates")
results <- tibble(results)
print(results)

```

```

## # A tibble: 2 x 1
##   results[, "Mean"] [, "Median"] [, "SD"]
##   <dbl>          <dbl>      <dbl>
## 1      3018274      24984 12378427
## 2       671722      33824 2212341

```

```

fec22.df %>%
group_by(V20==0) %>%
summarise(mean = mean(V6, na.rm = TRUE),
           median = median(V6, na.rm = TRUE),
           sd = sd(V6, na.rm = TRUE))

```

```

## # A tibble: 3 x 4
##   'V20 == 0'      mean median      sd
##   <lgl>          <dbl> <dbl>    <dbl>
## 1 FALSE        671722. 33824. 2212341.
## 2 TRUE         3018274. 24984 12378427.
## 3 NA           5997.  4782.  6224.

```

5. For the data that includes only House candidates, produce density plots that shows two distributions—one for candidates who are incumbents and one for candidates who are challengers. The variable CAND ICI equals “I” for incumbents, equals “C” for challengers, and equals “O” for candidates in open seat races. Write a sentence that summarizes what you see.

```

# Density Plot for House candidates
hou_df2 <- hou_df %>%
filter(V3 == "I" | V3 == "O" | V3 == "C")
p <- ggplot(hou_df2, aes(x=V3, fill= V3)) +
  geom_density(alpha=0.4)

print(p)

```

```
hou_df2 <- hou_df %>%
  filter(V3 == "I" | V3 == "C")
p <- ggplot(hou_df2, aes(x=log(V10), y = ..density.., fill= V3)) +
  geom_density(alpha=0.4)

print(p)
```

```
